

Locked Dashboard Architecture

Upgrade from Day 1

Day 1's dashboard let you select a ward only through the sidebar dropdown. Day 2's task specifically requires the architecture: **Map → Ward click → Detail card** — meaning clicking directly on the map itself must select a ward, not just the dropdown.

What changed

- Added `st.session_state.selected_ward` as a single source of truth for "which ward is currently selected"
- **Two paths now update it:**
 - Sidebar dropdown (unchanged from Day 1 — good for quick lookup / accessibility)
 - **Clicking a ward directly on the map** (new) — using Streamlit's `on_select="rerun" + selection_mode="points"` on the Plotly chart, which returns the clicked ward's index, which is then mapped back to its name
- The detail card always reflects whichever selection happened most recently, regardless of which path was used

Verified working

- Confirmed `on_select` and `selection_mode` parameters exist in the installed Streamlit version (1.62.0) — this feature is genuinely supported, not just written speculatively
- Syntax validated

What's real vs. placeholder (unchanged from Day 1)

● **Real:** all 48 ward boundaries/names, the map-click interaction itself ● **Placeholder:** UTCI/NCTL/CTBI/priority/vulnerability values are still dummy — swapped out on Day 4 once Garima's final spatial dataset (with real demographic + thermal joins) is ready

Why this matters for Day 4

This was the exact risk the original plan wanted eliminated on Day 1-2: discovering an integration problem (like "how do you even make map-click work in Streamlit") on Day 4 while trying to also finish everything else. That risk is now closed — Day 4 truly only requires a data swap, not new interaction logic.

Files produced

- `app_day2.py` — the dashboard with locked Map → Click → Detail card architecture

Handoff

- Ready to receive Garima's final spatial dataset and Khushi's action-engine logic on Day 4 — no UI/architecture changes needed at that point, only the `load_wards()` data-loading section changes.
