

# Streamlit Dashboard Skeleton (Connected to Real Ward Data)

## What was built

A working `app.py` with:

- Title + caption
- Sidebar ward-selection dropdown (populated from **real** ward names — 48 wards, not dummy placeholders)
- Main panel: interactive choropleth map of Ahmedabad using **Garima's real ward boundaries**
- Detail card: shows UTCI, NCTL, CTBI, vulnerability, response capacity, and priority for whichever ward is selected

## What's real vs. placeholder (important for honesty)

● **Real:** the 48 ward boundaries/shapes/names — sourced from Garima's `ahmedabad_wards_clean.geojson` ● **Placeholder (until Day 3-4):** the actual UTCI/NCTL/CTBI/priority/vulnerability values shown are randomly generated dummy numbers, clearly commented in the code and labeled on-screen with a caption

This matches the Day 1 goal exactly: prove the map/UI **integration** works end-to-end, without waiting for real thermal data.

## Map integration issue hit and fixed (worth noting for the team)

Plotly recently renamed `choropleth_mapbox` to `choropleth_map` (mapbox-token requirement removed, uses maplibre instead). Initial code failed with an `AttributeError` on the old function name — fixed by switching to the new function. **This is exactly the kind of small blocker the plan wanted resolved on Day 1, not discovered during Day 4 integration.**

## What Day 4 actually requires (should be minimal now)

Only the `load_wards()` function's dummy-data section needs to change — swap the `random.choice(...)` placeholder lines for a real join against Garima's final spatial dataset (Ward\_ID + CTBI + NCTL + UTCI + vulnerability + response capacity + priority). The map rendering code, layout, and detail card logic stay exactly the same. This is intentional — it's why the architecture (Map → Ward click → Detail card) was locked early.

## How to run

```
streamlit run app.py
```

(Requires `data/spatial/ahmedabad_wards_clean.geojson` to exist relative to where the app is run — same file Garima produced on Day 1.)

## Files produced

- `app.py` — the working Streamlit dashboard
- `map_test.png / map_test.html` — standalone proof that the real ward boundaries render correctly in a choropleth map, before being wired into the full app

## Handoff

- This dashboard is ready to receive Garima's final spatial dataset (Day 4) and Khushi's action-engine recommendations (Day 4) — no structural changes needed, just a data-source swap.
