

(Final Wrap-up)

1. Full Team Status — Day 3

Member	Task	Status
Dev	NCTL + CTBI (timezone-corrected, per-night, min-max normalized, sensitivity-tested)	✓ Complete
Khushi	CTBI sanity checks + priority rubric test (thermal-only, vulnerability pending)	✓ Complete
Shweta	Nighttime UTCI vs baseline graph + CTBI normalization audit	✓ Complete
Garima	Real spatial integration (546 days × 48 wards), file-size fixed	✓ Complete
Vrinda	Dashboard on real, complete data with date selector	✓ Complete

Day 3's scientific core is fully done and independently cross-validated by multiple team members — not just built once and trusted.

2. Real Proof Collected Today

- `nctl_graph.png`, `ctbi_graph.png`, `ctbi_sensitivity_graph.png` (Dev)
- `nighttime_utci_vs_baseline.png` (Shweta)
- `priority_rubric_v1_full_test.csv` — real CTBI/NCTL/UTCI for every ward, every day (Khushi + Garima)
- Working dashboard on real data, browsable across all 546 days (Vrinda)

3. Known Open Item — Carried Forward, Not New

Vulnerability/response-capacity data is still not available. This has been open since Day 2. Every team member has independently and consistently labeled their output as "thermal-only" or "pending" rather than fabricating numbers — this consistency across 5 different people's work is itself worth noting in the Decision Log as evidence of team-wide discipline around honesty.

This is now the single most important action item before Day 4 can fully proceed. Someone needs to manually visit ahmedabadcity.gov.in/SP/Demographics and

download the ward-wise Census file — this cannot be automated or worked around further.

4. GitHub Push Checklist

- `src/app.py` (Vrinda's final version — replaces earlier Day 3 version)
- `docs/Vrinda_Day3_Deliverable_Final.md`
- Confirm all Khushi/Shweta Day 3 files (already reviewed) are pushed:
`Khushi_Day3_CTBI_Sanity_Check.md`,
`Khushi_Day3_Completion_Summary.md`,
`Shweta_Day3_CTBI_Normalization_Audit.md`,
`Shweta_Day3_Completion_Summary.md`,
`khushi_day3_sanity_and_priority.py`, `nighttime_utc_i_vs_baseline.png`,
`priority_rubric_v1_full_test.csv`, `shweta_day3_graphs_and_audit.py`

5. End-of-Day-3 Team Question — Final Answer

"Kya hum real ERA5 → UTCI → NCTL → CTBI prove kar sakte hain?"

☒ **YES — and now with more rigor than Day 3 originally required.**

- Real ERA5 data, correctly timezone-corrected (IST) ☒
- Real UTCI, independently cross-validated (0.0 difference between two team members' implementations) ☒
- Real NCTL, per-night (not cumulative), sanity-checked against 3 physical scenarios ☒
- Real CTBI, formula independently recomputed by hand and matched exactly, sensitivity-tested ($\alpha=0.6/0.7/0.8$, correlation 0.938–0.947 across different verifications) ☒
- Real spatial join to all 48 actual Ahmedabad wards, across the full 546-day historical record ☒
- Every claim honestly labeled — no fabricated priority/vulnerability numbers anywhere ☒

The core project is not just safe — it's now more rigorously validated than a typical 5-day hackathon prototype usually is. The only remaining risk is entirely non-technical: one manual file download that's been outstanding since Day 2.

Handoff

- Push the checklist above
- **Whole team: prioritize the AMC manual download before starting Day 4** — everything else Day 4 needs (priority engine, action recommendations, final dashboard) depends on it.
